Introduction

Well-organised cervical cancer screening programmes can significantly reduce the incidence and mortality of the disease. The National Cervical Screening Programme (NCSP) was established in New Zealand in 1990, and since that time, the number of women who develop cervical cancer, and the number of women who die from it, has reduced by 60 percent. Having regular cervical smear tests continues to be a woman's best protection against the development of invasive cervical cancer.

One of the main performance measures of NCSP is coverage. Coverage is defined as the proportion of women eligible for screening who have been screened in the previous three years. Our target is to reach 80 percent screening coverage for all eligible women. While we have met this target nationally for European/ Other women, coverage rates for Maori, Asian and Pacific women remain at under 70 percent.

The incidence of cervical cancer among Māori, Pacific and Asian women remains higher than that among European/Other ethnicities. One of the primary reasons for this is lower rates of screening coverage among these groups.

This NCSP District Health Board Coverage Report is intended to support those working in increasing coverage and improving equity in cervical screening. Tihei mauri ora!

Technical notes

The number of women screened for the three year periods ending 30 June 2012, 2013 and 2014 were extracted from the National Cervical Screening Register (the Register) on 27 February 2013 for December 2012, on 17 February 2014 for December 2013 and 20 January 2015 for December 2014.

Screened women are included in the coverage calculations based on their age at the end of the monitoring period. This means that coverage for women aged 25–69 years includes women who were aged 22, 23 or 24 at the start of the monitoring period.

For both women screened and in the denominator, women have been prioritised to a single ethnicity using the following priority order: Māori, Pacific, Asian, European/Other. This means that if a woman chooses more than one category, and one of these is Māori, she is counted as Māori. The ethnicity recorded on the Ministry of Health's National Health Index has been used for any screened woman with no ethnicity recorded on the Register.

The denominators used for calculating coverage are derived from Statistics New Zealand's district health board (DHB) population projections 30 June 2014 update. For 31 December 2012 and 2013, the 2015 update of the 2001 to 2013 DHB population estimates based on the 2013 Census was used. Both the population projections and population estimates have been adjusted for the prevalence of hysterectomy.

Additional detail on the methodology can be obtained via a request made to screening@moh.govt.nz.

Tairawhiti Total coverage

Tairawhiti Total coverage by ethnicity in the three years ending 31 December 2014

Figure 1: NCSP coverage (%) in the three years ending 31 December 2014 by ethnicity, women aged 25–69 years, Tairawhiti District Health Board

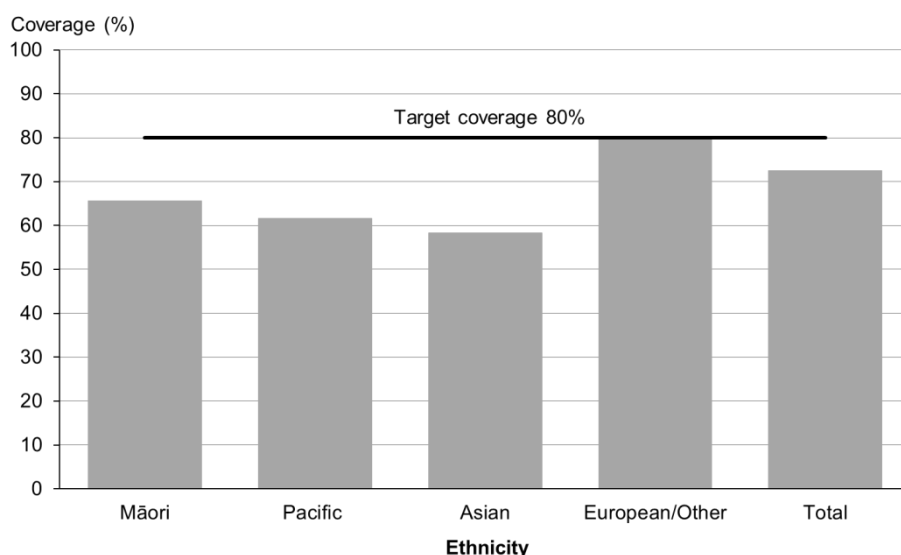

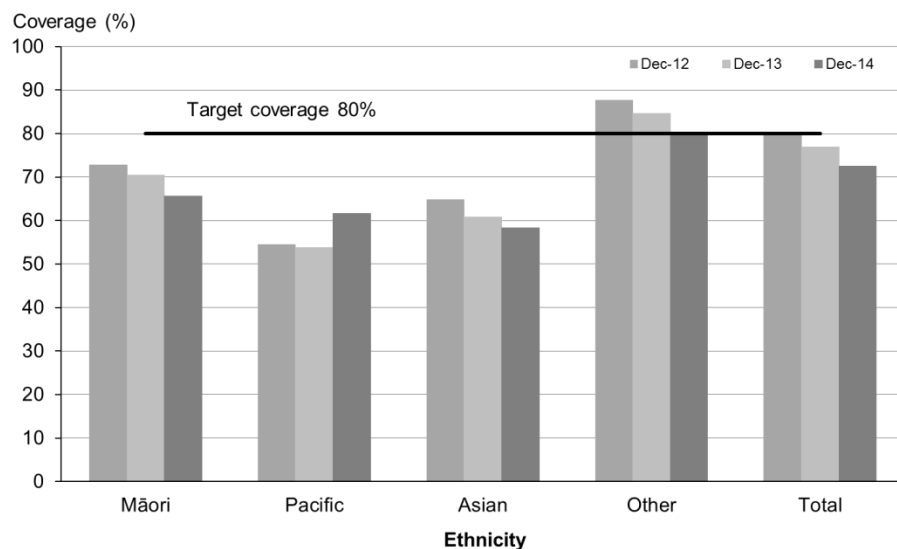

Table 1: NCSP coverage (%) in the three years ending 31 December 2014 by ethnicity, women aged 25–69 years, Tairawhiti District Health Board

Ethnicity	Population	Women screened in last 3 years	3-year coverage	Additional screens to reach 80% target*
Māori	5,279	3,466	65.7%	757
Pacific	242	149	61.7%	44
Asian	336	196	58.4%	73
European/Other	5,762	4,616	80.1%	
Total	11,619	8,427	72.5%	868

*For the total population the number of additional screens is the number required to move from the total population coverage to 80%. This may not be the same as the sum of additional screens required for each ethnic group to reach 80%.
